

BUILDING A WORLD OF DIFFERENCE®

BLACK & VEATCH

Western Renewable Energy Zones

Peer Analysis Tool User Guide and Methodology

Version 1.0

March 2009

Introduction

The Peer Analysis tool complements the Generation and Transmission Model (GTM), and is designed to assist load serving entities, regulators and renewable planners (“users”) to easily identify the cost and value of renewable resources delivered to different load zones. This also provides the capability to identify possible partnership opportunities.

This tool mimics the GTM methodology for resource cost and value determination, assuming point-to-point transmission costs. The difference is this tool is designed to provide the comparative information for multiple load zones simultaneously, while the GTM provides only limited comparisons.

The tool is designed to be used as a resource analysis and comparison tool by users. It is not meant to be used to develop resource portfolios.

The model is Excel based and is flexible, allowing users to adapt it to meet their specific requirements.

Introduction (cont'd)

- Tool allows users to see supply curve of all WREZ resources available to a load zone
- Users may change supply curves by modifying limited number of assumptions
- Tool includes ranking of resources for each load zone
- Tool uses adjusted delivered costs of resources assuming point-to-point transmission service

PEER Analysis Tool

User Guide

! System Configuration Information

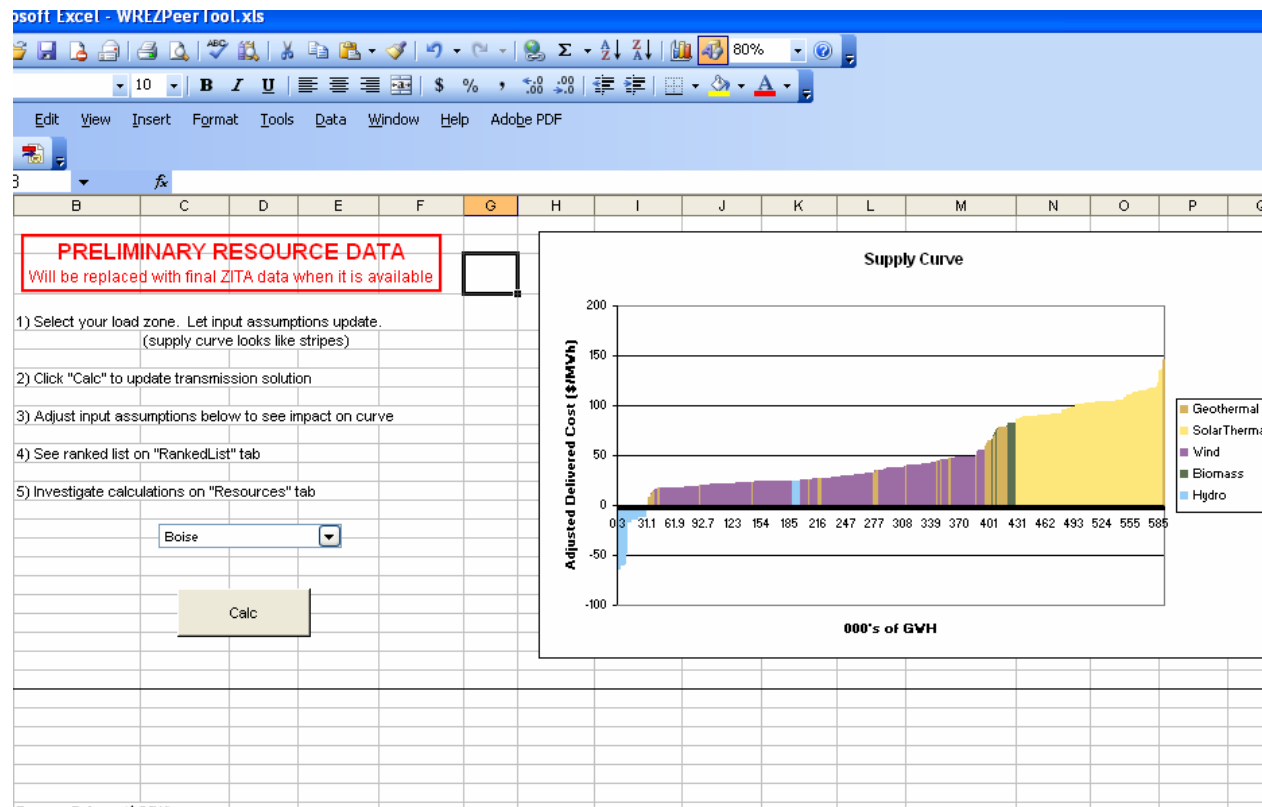

The GTM uses advanced macros and Excel must be configured to allow for use of these. When opening the GTM model the first time:

1. If “Security Warning” pops up on your screen; click “Enable Macros.”
The machine is properly configured
2. If the “Security Warning” does not appear on you screen, you will need to change the security level in Excel. Follow the instructions below ⁽¹⁾
 - A. Go to “Tools” on the menu bar
 - B. Select “Macros”
 - C. Select “Security”
 - D. A Security window will pop up on your screen
 - E. Select “Medium” and click “Ok”
 - F. Open WREZ Model and follow Step 2 above

1. These directions are for Office Version 2003 -- different versions of Office software may have security settings in different locations

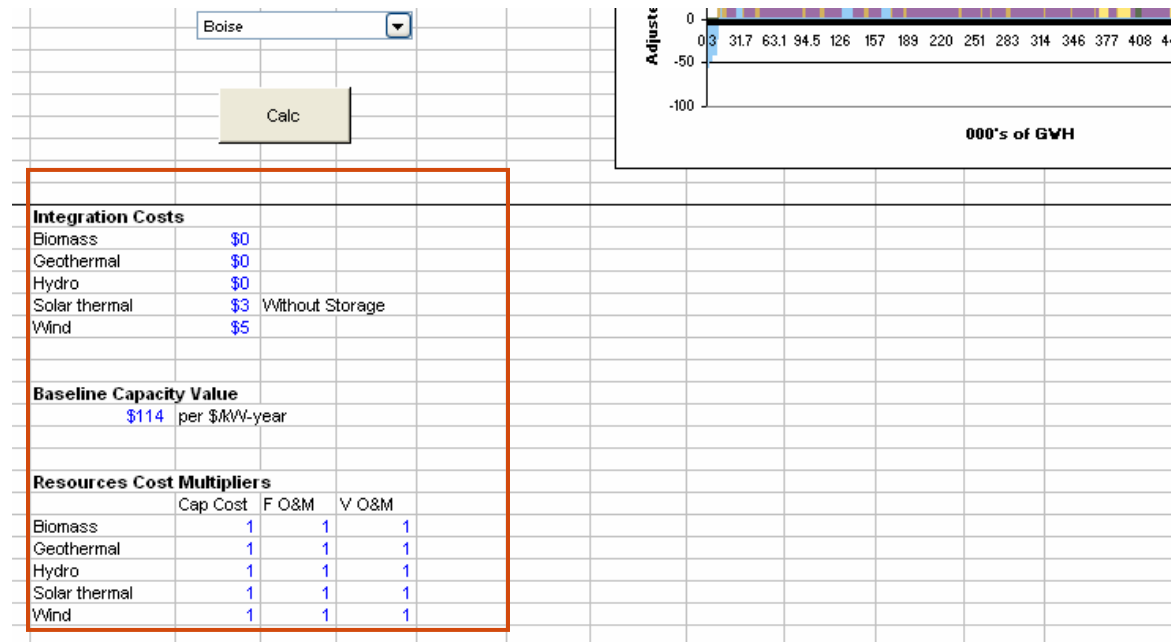

Developing a Supply Curve for a Load Zone

- Select a load zone from the drop down menu
- Click “Calc”
- A supply curve of all WREZ resources available to the selected load zone will be created

Modifying the Supply Curve

- User can adjust assumptions in blue and evaluate the effect on the supply curve. The following assumptions can be changed:
 - Integration costs
 - Capacity value
 - Resource cost multipliers

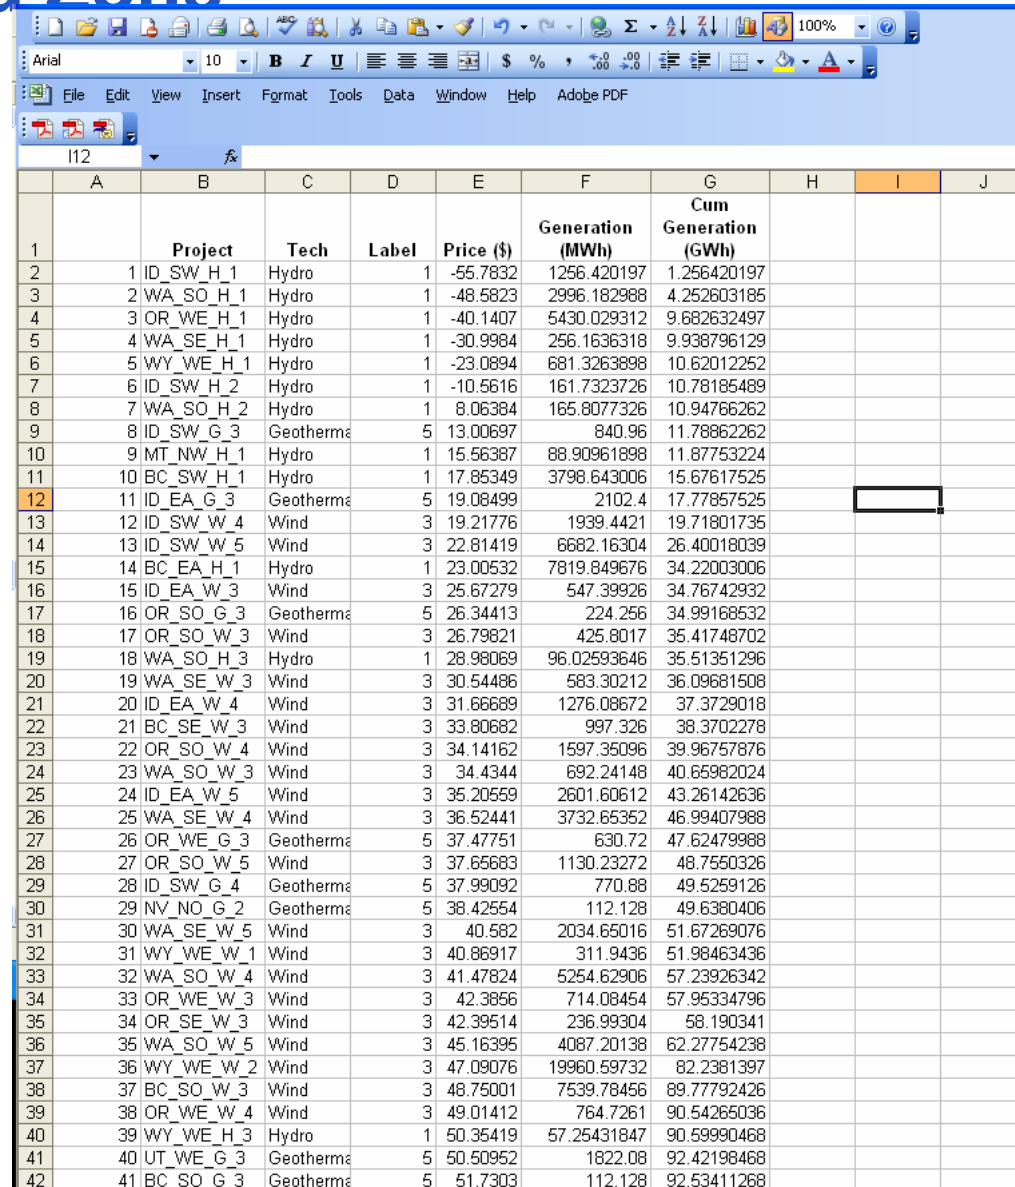

Modifying the Supply Curve (cont'd)

- Transmission assumptions
- Transmission financial assumptions

Ranking for Single Load Zone

- The tool ranks resources by delivered adjusted cost to the selected load zone (listed on RankedList sheet)
- The rankings are used to create the supply curve

Resource Ranking for Multiple Load Zones

- Tool can help identify partnership opportunities
 - Compare top ranking projects with other load zones
 - Partnership should be considered for projects that rank highly for two or more load zones (highlighted in the example below)

| Seattle | | | Boise | | Portland | | Sacramento | | |
|---------|---------|-----------|------------|-----------|------------|-----------|------------|-----------|------------|
| | Project | Price | Project | Price | Project | Price | Project | Price | |
| Rank | 1 | OR_WE_H_1 | \$ (33.18) | OR_WE_H_1 | \$ (27.59) | OR_WE_H_1 | \$ (35.07) | OR_WE_H_1 | \$ (25.34) |
| | 2 | WA_SO_H_1 | \$ (27.48) | WA_SO_H_1 | \$ (24.95) | WA_SO_H_1 | \$ (29.38) | WA_SO_H_1 | \$ (21.99) |
| | 3 | ID_SW_H_1 | \$ (16.57) | ID_SW_H_1 | \$ (23.59) | ID_SW_H_1 | \$ (17.20) | ID_SW_H_1 | \$ (17.89) |
| | 4 | WA_SE_H_1 | \$ (9.61) | WY_WE_H_1 | \$ (9.40) | WA_SE_H_1 | \$ (6.27) | WY_WE_H_1 | \$ (4.32) |
| | 5 | WY_WE_H_1 | \$ 0.80 | WA_SE_H_1 | \$ (6.81) | WY_WE_H_1 | \$ 1.02 | WA_SE_H_1 | \$ 1.71 |

Useful for identifying potential partnership opportunities!

Allocating Resources – Example Overview

- Not everyone can have the best resources
 - Some resources will be highly ranked for all the load zones
 - There will be competition for these limited best resources
- Tool can also be used to allocate resources
 - The user can create a cost matrix of adjusted delivered costs for all resource to each of the load zones
 - For example, allocate each resource to the top 3 load zones by cost

Allocating resources - Resource Cost Matrix

- By copying the results from the “Resources” sheet for each load zone and pasting into a new sheet, the user can create a resource cost matrix
- A resource cost matrix will show the cost of each project for each load zone

Allocating Resources - Relative Ranking

- For each project, by ranking each load zone from lowest to highest cost, the user can begin to see the relative attractiveness of resources to each zone
- In this example, each resource is allocated to the top 3 load zones where resource is most valuable

| ID | | Albuquerque | Billings | Boise | Calgary | Casper | Denver | El Paso | Las Vegas | Los Angeles | Northern California | Phoenix | Portland | Reno | Salt Lake City | San Francisco | San Diego | Seattle | Spokane | Tucson | Vancouver |

PEER Analysis Tool

Methodology

Methodology

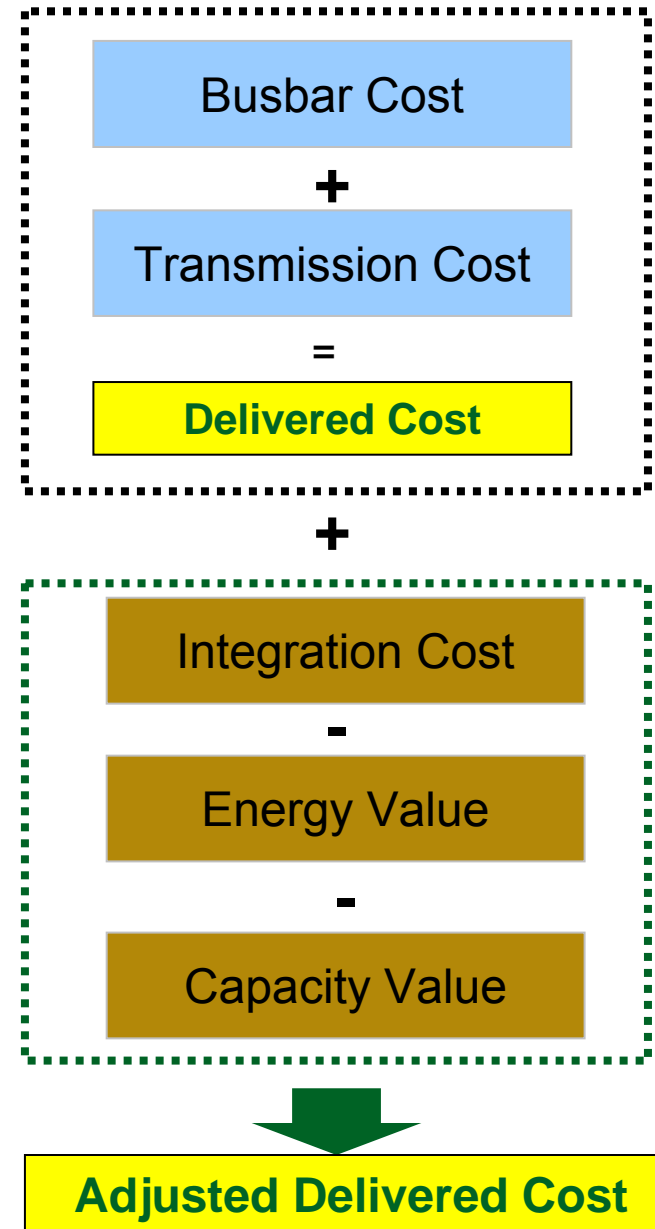

- Overview
- Adjusted Delivered Cost
- Transmission
- Transmission Losses
- Integration Costs
- Energy Value
- Capacity Value

Methodology Overview

- Model based on Year 2015 information
 - Loads
 - Costs
 - Resource technologies
- All cost inputs and outputs in \$ 2009

Adjusted Delivered Cost

- Busbar cost – “raw” cost of generation
- Delivered cost – cost to deliver energy to load zones
- Adjusted Delivered cost – the *value* of a resource to a load zone, taking into consideration the energy and capacity benefit delivered by the resource

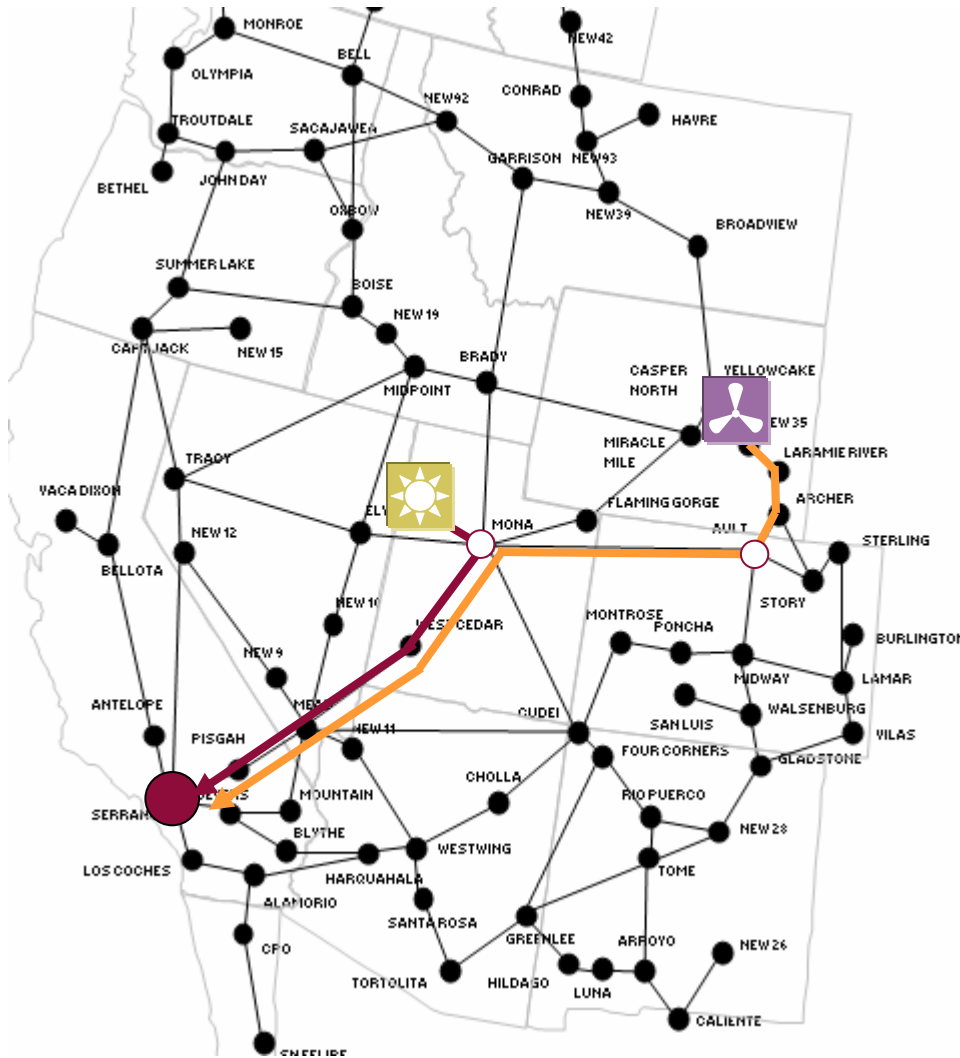

Transmission

- All transmission costs based on point-to-point routing over existing rights of way

!! NOTE: The transmission cost in the Peer Analysis Tool is fixed, and cannot be redefined by users within the tool as may be done in the GTM model

- Pro-rata costs for transmission of each resource to load zone is calculated using the user defined utilization (GTM model calculates utilization based on generation profiles of the resources on the transmission line)

Point-to-Point Transmission

- Each resource has a separate transmission route to the load zone
- Transmission routing is based on the shortest distance over existing Right of Ways

Transmission Losses

- Losses are based on distance from busbar to load zone and line voltage
- Losses applied to the delivered cost of the resource

$$\begin{array}{|c|} \hline \text{Delivered} \\ \text{Cost after} \\ \text{Losses} \\ \hline \end{array} = \frac{\text{Cost at Busbar (\$/MWh)} + \text{Transmission Cost (\$/MWh)}}{(1 - \% \text{ Transmission Loss})}$$

Integration Cost

- Integration cost of a project is the indirect operation cost to the grid to accommodate the generation from a project
- Integration costs are determined by resource type
 - Wind - \$5/MWh
 - Solar thermal - \$2.50/MWh
 - Biomass - \$0.00/MWh
 - Geothermal - \$0.00/MWh

Energy Value

- Energy value of a resource represents the value of its hourly output to the load zone – i.e. the load zone's energy price forecast value
- Energy values based on 2015 market forecast (\$2009) developed using ProMod production cost model
- Average hourly energy prices by month are included in the price forecast for each load zone

$$\text{Energy Value (\$/MWh)} = \sum \frac{(\text{Energy Value in Time Period}) \times (\text{Energy Output in Time Period})}{\text{Total Energy Output}}$$

Energy Value (cont'd)

- 2015 Energy Price Forecast
 - Developed by B&V using ProMod production cost software
 - CO₂ at \$35/ton
 - Fuel cost approximately \$10/MMBtu
 - Zonal Transmission Model – Each market zone is connected to series of others with transmission links or interfaces that have been assigned bi-directional energy and capacity limits, wheeling charges (when applicable) and losses

Capacity Value

“Capacity Credit Factor” approach

- Each project's capacity value is based on its contribution to resource reserve margin requirements. The capacity value represents the avoided expense of purchasing an alternative source of capacity: a gas turbine generator
 - Avoided adequacy cost calculated from the levelized fixed costs of a gas turbine
- The contribution to resource reserve margin is based on a capacity credit factor calculated for each project
 - Capacity credit factor is defined as the capacity factor of the resource during the peak period (top 10% of load hours) over the entire year
 - Gas turbine capacity credit factor is assumed to be 100%
- Capacity Value (\$/kW-yr) = capacity credit factor * avoided resource reserve margin costs

No WECC – wide standards exist for calculating capacity credit
